JAVA PRACTICAL PROGRAM REPORT

Order Details and Total Amount Program

Program/Class Name: OrderExample.java

Language: Java

Topic: Scanner input; integer, string, and double variables; multiplication; nextLine() to consume the newline after nextInt().

This report presents the aim, requirements, program logic, UML-style class diagram, source code, execution commands, sample console output, and conclusion.

1. Aim

To accept order details and calculate the total amount by multiplying quantity by unit price.

2. Requirements

• Java Development Kit (JDK)
• Text editor or Java IDE
• Save the source code using the public class name as the filename.

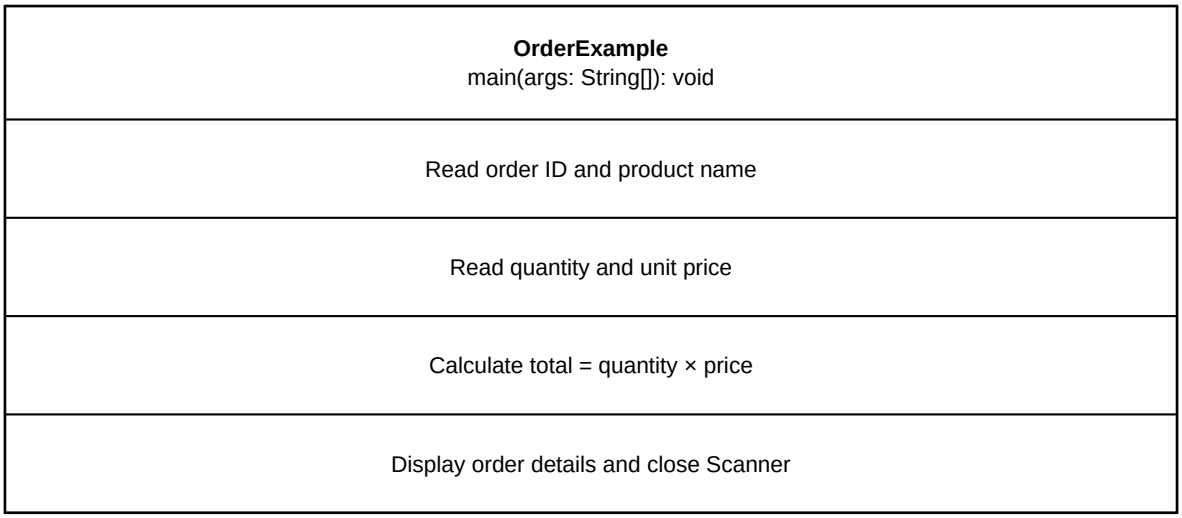
3. Concepts Used

Scanner input; integer, string, and double variables; multiplication; nextLine() to consume the newline after nextInt().

4. Algorithm

1. Start the program and create a Scanner object.
2. Read the order ID.
3. Consume the pending newline and read the product name.
4. Read quantity and unit price.
5. Calculate total = quantity × price.
6. Display the order ID, product, quantity, price, and total amount.
7. Close the Scanner and end.

5. UML / Class Diagram



The diagram summarizes the main class flow and the key methods or calculations used by the program.

6. Source Code

```
import java.util.Scanner;

public class OrderExample {
    public static void main(String[] args) {

        Scanner sc = new Scanner(System.in);

        System.out.print("Enter Order ID: ");
        int orderId = sc.nextInt();

        sc.nextLine();

        System.out.print("Enter Product Name: ");
        String product = sc.nextLine();

        System.out.print("Enter Quantity: ");
        int quantity = sc.nextInt();

        System.out.print("Enter Price: ");
        double price = sc.nextDouble();

        double total = quantity * price;

        System.out.println("\n--- Order Details ---");
        System.out.println("Order ID: " + orderId);
        System.out.println("Product: " + product);
        System.out.println("Quantity: " + quantity);
        System.out.println("Price: " + price);
        System.out.println("Total Amount: " + total);

        sc.close();
    }
}
```

7. Compilation and Execution

```
javac OrderExample.java
java OrderExample
```

8. Sample Console Output

The source code was compiled and run in the available Java environment. For interactive programs, typed inputs are shown beside their prompts for readability.

```
Enter Order ID: 501
Enter Product Name: Notebook
Enter Quantity: 4
Enter Price: 25.5
Enter Order ID: Enter Product Name: Enter Quantity: Enter Price:
--- Order Details ---
Order ID: 501
Product: Notebook
Quantity: 4
Price: 25.5
Total Amount: 102.0
```

9. Result / Conclusion

The program collects order information, multiplies the quantity by the unit price, and displays the computed total. With the sample values, the total amount is 102.0.
