JAVA PRACTICAL PROGRAM REPORT

Employee Payroll Calculator

Program Name: EmployeePayroll.java

Language: Java

Topic: Salary components and net salary calculation

This report explains the supplied Java program, the payroll formulas, algorithm, class structure, source code, compilation commands, and sample console output.

1. Aim

To accept an employee's name and basic salary, calculate HRA, DA, gross salary, tax, and net salary, and display the payroll details.

2. Requirements

• Java Development Kit (JDK)
• Text editor or Java IDE
• Save the source file as **EmployeePayroll.java**

3. Formulas Used

HRA = Basic Salary × 20%

DA = Basic Salary × 10%

Gross Salary = Basic Salary + HRA + DA

Tax = Gross Salary × 5%

Net Salary = Gross Salary – Tax

4. Algorithm

1. Start the program.

2. Create a Scanner object to read keyboard input.

3. Read the employee name and basic salary.

4. Calculate HRA as 20% of the basic salary.

5. Calculate DA as 10% of the basic salary.

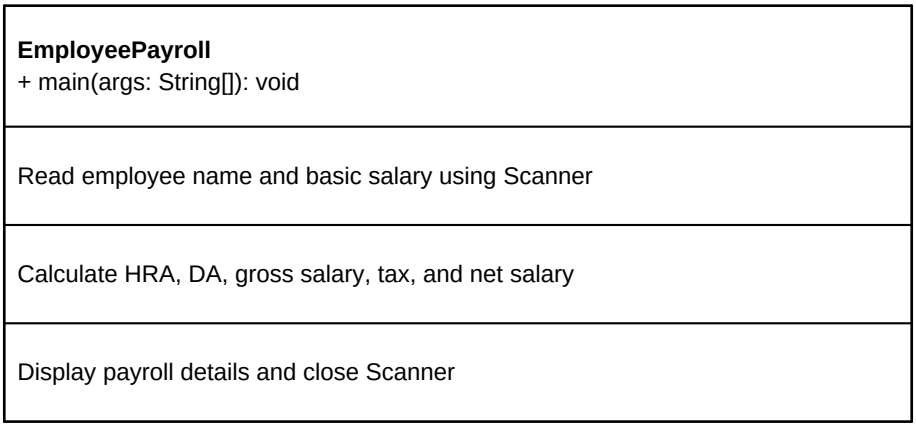
6. Calculate gross salary by adding basic salary, HRA, and DA.

7. Calculate tax as 5% of gross salary.

8. Calculate net salary by subtracting tax from gross salary.

9. Display all payroll details, close Scanner, and end.

5. UML / Class Diagram



The program contains one class, EmployeePayroll, with the main method. It reads two inputs, calculates the salary components, prints the results, and closes the Scanner.

6. Source Code

```
import java.util.Scanner;

public class EmployeePayroll {
    public static void main(String[] args) {

        Scanner sc = new Scanner(System.in);

        System.out.print("Enter Employee Name: ");
        String name = sc.nextLine();

        System.out.print("Enter Basic Salary: ");
        double basicSalary = sc.nextDouble();

        double hra = basicSalary * 0.20;
        double da = basicSalary * 0.10;
        double grossSalary = basicSalary + hra + da;

        double tax = grossSalary * 0.05;
        double netSalary = grossSalary - tax;

        System.out.println("\n--- Employee Payroll ---");
        System.out.println("Employee Name: " + name);
        System.out.println("Basic Salary: " + basicSalary);
        System.out.println("HRA: " + hra);
        System.out.println("DA: " + da);
        System.out.println("Gross Salary: " + grossSalary);
        System.out.println("Tax: " + tax);
        System.out.println("Net Salary: " + netSalary);

        sc.close();
    }
}
```

7. Compilation and Execution

```
javac EmployeePayroll.java
java EmployeePayroll
```

Sample input values: Employee Name = Asha Kumar; Basic Salary = 30000.

8. Console Output

The source was compiled and run in the available Java environment. The sample interaction below shows the typed input beside each prompt for readability.

```
Enter Employee Name: Asha Kumar
Enter Basic Salary: 30000
Enter Employee Name: Enter Basic Salary:
--- Employee Payroll ---
Employee Name: Asha Kumar
Basic Salary: 30000.0
HRA: 6000.0
DA: 3000.0
Gross Salary: 39000.0
Tax: 1950.0
Net Salary: 37050.0
```

9. Result / Conclusion

The program calculates HRA as 20% and DA as 10% of basic salary, adds them to determine gross salary, deducts tax at 5%, and displays the net salary. For the sample basic salary of 30000, the net salary is 37050.0.
